BRAINSTORM AND PRIORITIZE IDEAS

Our problem statement is about plasma donor, discussing this problem we team members came out with few solutions out of all the solutions we discussed we are here going to upload the top three ideas.

IDEA 1:

We are going to develop a web page for plasma donor with a form in it where they can fill their details and register themselves if there are interested to donate plasma using this the recipient can contact the donor on time.

IDEA 2:

When a user register themselves as a donor he/she must often update their health issue related things for further eligibility contribution ,so that it would be easy for the recipient to filter .

IDEA 3:

Since during the pandemic time people faced many issue and the main issue was lack of plasma donor due to location problems to overcome this user has to feed his location all the time with the help of mean location requirements via which patients can directly call the donor by taking his/her contact number from the application. The user can also view the total active cases, recovered cases, vaccine centers in their area, hospital location, and helpline number.
